

Generating Traffic to a Firewall

Goal: Set up and run traffic to test a firewall.

In this test scenario, LANforge-FIRE is used to generate traffic to a firewall DUT in order to measure the following benchmarks:

- **UDP Throughput** - Maximum payload bits per second with a UDP traffic flow.
- **TCP Throughput** - Maximum payload bits per second with a TCP traffic flow.
- **TCP Concurrent Connections** - Maximum number of simultaneous TCP connections.
- **TCP Connections per Second** - Maximum number of established TCP connections per second.

NOTE: If you are attempting to run this test scenario, you will need a LANforge license key that enables the correct number of ports and multi-connections. Please contact us at support@candelatech.com for assistance.

1. The **UDP Throughput** test will use a scripted Layer-3 connection to vary the rate and payload size to determine the bi-directional UDP throughput of the DUT across the scripted parameters.

A. On the Port Manager tab, set up the LANforge ports with valid IP addresses.

B. On the Layer-3 tab, create a UDP connection.

- A. Set Endpoint A to use the DUT WAN port.
- B. Set Endpoint B to use the DUT LAN port.
- C. Make sure CX Type is LANforge / UDP then select **Apply**.

C. Select the **Script** button to set up the scripting parameters.

- A. Set up the script to iterate over the rates.
- B. Specify the payload sizes to be tested.

For more information see [LANforge FIRE Cookbook example: Scripted Layer-3 Test](#)

D. Highlight the connection and select the **Start** button.

The screenshot shows the LANforge Manager interface. At the top, there are menu items: Control, Reporting, Tear-Off, and Help. Below the menu is a toolbar with buttons for Stop All, Restart Manager, Refresh, and HELP. A series of tabs are visible: File-IO, Layer-4, Generic, Test Mgr, Resource Mgr, Serial Spans, PPP-Links, Port Mgr, Messages, Status, Layer-3, L3 Endps, VoIP/RTP, VoIP/RTP Endps, Armageddon, WanLinks, and Collision-Domains. The 'Test Mgr' tab is active. In the center, there are controls for 'Rpt Timer (ms): 3000' and 'Test Manager: all', with 'Go' buttons. To the right are buttons for 'Select All', 'Start', 'Stop', 'Quiesce', and 'Clear'. Below these are 'View: 0 - 200' and buttons for 'Display', 'Create', 'Modify', and 'Delete'. A table titled 'Cross Connects for Selected Test Manager' is displayed, containing one row of data. At the bottom, a status bar reads 'Logged in to: 192.168.100.173:4002 as: Admin'.

Name	Type	State	Pkt Tx A->B	Pkt Tx A<-B	Rate A->B	Rate A<-B	Rx Drop A	Rx Drop B	Rpt Timer	EID	Endpoints (A <-> B)

E. The final test report shows the results of the test run. Here we can see that the DUT has the best bi-directional throughput with 1460Byte payloads at 24.9Mbps.

For more information see [Full script report for the UDP test.](#)

2. The **TCP Concurrent Connections** test will measure the maximum number of simultaneous TCP connections that the DUT can maintain at once.

A. On the Port Manager tab, create 5 MAC-VLANs on the LANforge port connected to the DUT LAN port.

Create VLANs on Port: 1.1.2

1 **MAC-VLAN** 802.1Q-VLAN Redirect Bridge GRE Tunnel
 WiFi STA WiFi VAP WiFi Monitor WiFi Virtual Radio

2 Shelf: 1 Resource: 1 (ct503-60) Port: 6 (eth6)

3 VLAN ID: DHCP-IPv4
Parent MAC: 00:90:0b:38:82:75 DHCP Client ID: None
MAC Addr: xx:xx:xx:*:*:xx IP Address: 192.168.0.201/24 Global IPv6: AUTO
Quantity: 5 IP Mask or Bits: Link IPv6: AUTO
Gateway IP: 192.168.0.1 IPv6 GW: AUTO
#1 Redir Name: #2 Redir Name:
STA ID: SSID:
WiFi AP: Key/Phrase:
 WPA WPA2 WEP

4 Down

B. Verify that the MAC-VLANs have correct IP addresses.

- C. Create a Layer-3 connection that has a low-speed rate with **Multi-Conn** set to 10000 and **Min IP Port** to 0 (zero) on Endpoint-A. **Multi-Conn** should be set to 1 on Endpoint-B.

- A. Endpoint-A will be one of the MAC-VLANs and Endpoint-B will be the port connected to the DUT WAN port. This setup will initiate the TCP sessions from the LAN side of the DUT.
- B. Low-speed depends on the DUT, we could also set the rate to zero which would allow the TCP connections to be set up without payload data to be transmitted, but this would not give an accurate picture of the firewall performance. Here we are using 1Kbps connections with 1KB size payload.
- C. This is an iterative test, the number of TCP connections to use will depend on the DUT capabilities. Modify the number of connections as necessary to find the most accurate measurement.
- D. The DUT should be power-cycled to reset it before each test run.

D. Select the Batch-Create button to create 4 more copies of this connection each with a new MAC-VLAN port.

The screenshot shows a dialog box titled "Layer-3 Batch Creator: tcp-max-1". The dialog contains the following configuration details:

- Batch Name: tcp-max-2, tcp-max-3 ... tcp-max-5
- Endp-A Resources: 1, 1 ... 1
- Endp-B Resources: 1, 1 ... 1
- Endp-A Ports: eth6#1, eth6#2 ... eth6#4
- Endp-B Ports: eth7, eth7 ... eth7
- Endp-A IPs: AUTO, AUTO ... AUTO
- Endp-B IPs: AUTO, AUTO ... AUTO

Below these details are several input fields for customizing the batch creation:

- Quantity: 4
- Number of Digits: 1
- Zero Pad
- Starting Name Suffix: 1
- Name Increment: 1
- Resource Increment A: 0
- Resource Increment B: 0
- Port Increment A: 1
- Port Increment B: 0
- IP Addr Increment A: 0
- IP Addr Increment B: 0
- IP-Port Increment A: 1
- IP-Port Increment B: 1

At the bottom of the dialog are two buttons: "Apply" and "Close".

E. Highlight and start each set of 10000 connections until the target max simultaneous connections are running.

H. Scroll right to the CX Active and CX Established columns and select the **Refresh** button. This DUT can maintain a maximum of 41,864 simultaneous TCP connections.

- A. **CX Active** is the metric we are attempting to measure for Maximum Simultaneous TCP Connections. It will fluctuate with the DUT's ability to maintain the number of active TCP connections.
- B. **CX Established** is the number of TCP connections LANforge has established since the start of the test. It will continue to increase as the DUT closes the TCP connections it cannot maintain.

3. The **TCP Connections per Second** test will measure the rate of TCP connections that can be set up through the DUT.

A. Create a Layer-3 TCP connection with the Duration and IP Port set to zero.

tcp-cxps - Create/Modify Cross Connect

1 Cross-Connect
CX Name: tcp-cxps
CX Type: LANforge / TCP
Resource: Endpoint A (Client): 1 (ct503-60), Endpoint B (Server): 1 (ct503-60)
Port: Endpoint A (Client): 6 (eth6), Endpoint B (Server): 7 (eth7)
Min Tx Rate: Zero (0 bps)
Max Tx Rate: Same
Min PDU Size: 1k (1,024 B)
Max PDU Size: Same
IP ToS: Best Effort (0)
Pkts To Send: Infinite

2 Report Timer
Report Timer: fast (1 s)
Pld Pattern: increasing
Min IP Port: Any (0)
Max IP Port: Same
Min Duration: 0 (0 ms)
Max Duration: Same
Min Reconn: 0 (0 ms)
Max Reconn: Same
Multi-Conn: Normal (0)

3 Test Manager
Test Manager: default_tm
Quiesce: 3 (3 sec)
IP Addr: Endpoint A (Client): AUTO, Endpoint B (Server): AUTO
Replay File:
Loop:
Dest Mac:

4 Snd Buff Size
Snd Buff Size: OS Default
Rcv Buff Size: OS Default
Send Bad FCS: zero (0%)
Src MAC: 00:00:00:00:00:00
Proxy Addr: 0.0.0.0
Proxy Port: 0
Socket Priority: 0
Payload:

Buttons: Display, Sync, Batch-Create, Apply, OK, Cancel

B. Highlight and Start the connection.

C. View the **CX-Estab/s** rate on the Layer-3 Endpoints tab. This DUT can set up about 120 connections per second.

The screenshot shows the LANforge Manager GUI. The 'Layer-3 Endps' tab is selected. The interface includes control buttons like 'Stop All', 'Restart Manager', 'Refresh', and 'HELP'. Below the navigation tabs, there are input fields for 'MIN Pkt Size', 'MAX Pkt Size', 'MIN Tx Rate', and 'MAX Tx Rate', each with a 'Go' button. A 'View' dropdown is set to '0 - 400'. Action buttons 'Display', 'Create', 'Modify', 'Batch Modify', and 'Delete' are also present.

The main data table is titled 'All Endpoints' and contains the following columns: OOO Pkts, RX Wrong..., CRC Fail, RX BER, CX Active, CX Estab, CX-Estab/s, Pattern, Min Pkt, Max Pkt, Min Rate, Max Rate, and Se. The table shows multiple rows of endpoint data, with two rows highlighted in blue. The highlighted rows show a 'CX-Estab/s' rate of 119.

OOO Pkts	RX Wrong ...	CRC Fail	RX BER	CX Active	CX Estab	CX-Estab/s	Pattern	Min Pkt	Max Pkt	Min Rate	Max Rate	Se
