

Querying the LANforge JSON API using Python

Goal: Use Python scripts to query the LANforge Client JSON API. (See Querying the LANforge GUI for JSON Data) The provided Python scripts allow you the same API scope as the Perl scripts.

LANforge now provides Python scripts that query the REST API that the LANforge Client now exposes by default. This chapter steps through using each of the scripts. At the end we show an example of how to write a Python script. Scripts encourage Python 3. Requires LANforge 5.4.1 or later.

Client Settings

On your LANforge Server, the scripts directory is located at `/home/lanforge/scripts`. Under that directory, the `py-json` directory contains Python scripts.

Script	Purpose
<code>__init__.py</code>	Defines the py-json module
<code>show_ports.py</code>	Simplest example of querying all ports. This is typical of querying any of the APIs you browse from / or /help
<code>create_sta.py</code>	Script creates a virtual station
<code>LANforge/__init__.py</code>	Defines the py-json/LANforge module
<code>LANforge/LFRequest.py</code>	Use the LFRequest module to help make GET and POST requests to the LANforge Client
<code>LANforge/LFUtils.py</code>	Use the LFUtils module to help process JSON results

Getting Started

First, start the LANforge Client (LANforge GUI) and connect it to your LANforge Server. If you want to start the client in headless mode, open a terminal, and from the `LANforgeGUI_5.4.1` directory, start the script with the `-daemon` argument:

```
$ ./lfclient -daemon -s localhost
```

Querying Ports

Running the script

In the `/home/lanforge/scripts/py-json` directory:

```
$ python3 ./show_ports.py
{ '1.1.eth0': { '_links': '/port/1/1/0',
               'alias': 'eth0',
               'phantom': False,
               'port': '1.1.00'}}
{ '1.1.eth1': { '_links': '/port/1/1/1',
               'alias': 'eth1',
               'phantom': False,
               'port': '1.1.01'}}
{ '1.1.sta00500': { '_links': '/port/1/1/9',
                  'alias': 'sta00500',
                  'phantom': False,
                  'port': '1.1.09'}}
{ '1.1.sta00501': { '_links': '/port/1/1/10',
                  'alias': 'sta00501',
                  'phantom': False,
                  'port': '1.1.10'}}
{ '1.1.sta00502': { '_links': '/port/1/1/11',
                  'alias': 'sta00502',
                  'phantom': False,
                  'port': '1.1.11'}}
```

Looking inside the script

This script is a way of pretty-printing the results of `GET http://localhost:8080/port/1/1/list`

```
lf_r = LFRequest.LFRequest("http://localhost:8080/port/1/1/list")
json_response = lf_r.getAsJson()
j_printer = pprint.PrettyPrinter(indent=2)
for record in json_response['interfaces']:
    j_printer.pprint(record)
```

Other variations of this you can try are:

```
/port/list
```

This is an abbreviation

`/port/1/2/list`

If you have a second LANforge resource

`/port/1/2/eth0`

Show a specific port

Example of Creating a Station

Running the script

```
[lanforge@ct524-debbie py-json]$ python3 ./create_sta.py
Example 1: will create stations sta0200,sta0201,sta0202
Ex 1: Checking for station : http://localhost:8080/port/1/1/sta0200
...
Ex 1: Next we create stations...
Ex 1: Next we create station sta0200...
Ex 1: station up sta0200...

Example 2: using port list to find stations
Ex 2: checking for station : sta0220
Ex 2: create station sta0220
Ex 2: set port sta0220

Example 3: bring ports up and down
Ex 3: setting ports up...
Ex 3: setting ports down...
...ports are down
Example 4: Modify stations to mode /a
using add_sta to set sta0200 mode

Example 5: change station encryption from wpa2 to wpa3...
using add_sta to set sta0200 wpa3

Example 7: alter TX power on wiphy0...
```

Looking inside the script

Create a station

```
lf_r = LfRequest.LfRequest(base_url+"/cli-form/add_sta")
```

Flags are a decimal equivalent of a hexadecimal bitfield you can submit as either 0x(hex) or (dec) a helper page is available at http://localhost:8080/help/add_sta

You can watch console output of the LANforge GUI client when you get errors to this command, and you can also watch the websocket output for a response to this command at <ws://localhost:8081>. Use `$ wsdump ws://localhost:8081/` to follow those messages.

Modes are listed at <http://localhost/LANforgeDocs-5.4.1/lfcli Ug.html> or at <https://www.candelatech.com/lfcli Ug.html>

The MAC address field is a pattern for creation: entirely random mac addresses do not take advantage of address mask matchin in Ath10k hardware, so we developed this pattern to randomize a section of octets:

XX

keep parent

*

randomize

chars [0-9a-f]

use this digit

If you get errors like "X is invalid hex character", this indicates a previous `rm_vlan` call has not removed your station yet: you cannot rewrite mac addresses with this call, just create **new** stations.

The `staNewDownStaRequest()` creates a station in the Admin-Down state. This is a good way to efficiently create batches of stations because it defers all the PHY layer activity which takes significant time when you do it in a loop.

```
lf_r.addPostData( LfUtils.staNewDownStaRequest(sta_name, resource_id=resource_id, radio=radio, ssid=ssid, passph
lf_r.formPost()
sleep(0.05)
```

Sleeping for 50ms is not sufficient to interact with the station, but is a functional minimum to allow the LANforge to start processing the command; this is a good value to use in a loop that creates stations. Follow with:

```
LfUtils.waitUntilPortsAppear(resource_id, desired_stations)
```

Set station up

The LANforge API separates STA creation and Ethernet port settings. We need to revisit the stations we create and amend flags to add things like DHCP or ip+gateway, admin-{up,down} for sta_name in desired_stations:

```
lf_r = LfRequest.LfRequest(base_url+"/cli-json/set_port")
data = LfUtils.portDhcpUpRequest(resource_id, sta_name)
lf_r.addPostData(data)
lf_r.jsonPost()
```

```
sleep(0.05)
```

Set station down

```
for sta_name in desired_stations:
    lf_r = LfRequest.LfRequest(base_url+"/cli-json/set_port")
    lf_r.addPostData(LfUtils.portDownRequest(resource_id, sta_name))
    lf_r.jsonPost()
LfUtils.waitUntilPortsAdminDown(resource_id, desired_stations)
```

Change station mode

There is not a `set_sta` command. Many LANforge CLI commands do a default **modify** if the entity already exists. This is how we can modify attributes of existing stations. For the mode values, see

http://www.candelatech.com/lfcli_ug.php#add_sta

```
for sta_name in desired_stations:
    lf_r = LfRequest.LfRequest(base_url+"/cli-json/add_sta")
    lf_r.addPostData({
        "shelf":1,
        "resource": resource_id,
        "radio": radio,
        "sta_name": sta_name,
        "mode": 1, # 802.11a
    })
    lf_r.jsonPost()
sleep(0.5)
```

Change station protocol

Flags for `add_sta` and `set_port` are actually 64-bit values. When the values in the command below are read by the `/help/add_sta` page, Javascript cannot deal with integers greater than 32-bits long.

```
lf_r = LfRequest.LfRequest(base_url+"/cli-json/add_sta")
lf_r.addPostData({
    "shelf":1,
    "resource": resource_id,
    "radio": radio,
    "sta_name": sta_name,
    "mode": 0, # mode AUTO

    # sets use-wpa3
    "flags": 1099511627776,

    # sets interest in use-wpa3, wpa2_enable (becomes zero)
    "flags_mask": 1099511628800
})
print("using add_sta to set %s wpa3"%sta_name)
lf_r.jsonPost()
```

Change radio power on radio wiphy0

Virtual stations do not have individual tx power states. You can set the radio transmit power. See

http://www.candelatech.com/lfcli_ug.php#set_wifi_radio. The txpower is set through `iwconfig`, so see **man 8 iwconfig**. Power is in dBm, **auto** or **off**.

Not all flags in a JSON request are actually LANforge CLI parameters. The `suppress_preexec_method` parameter is a meta-flag tells the LANforge client to not check that the port exists before issuing the command. You would use this to expedite a script, because a check-port command is synchronous, not intended to be used in a loop.

```
lf_r = LfRequest.LfRequest(base_url+"/cli-json/set_wifi_radio")
lf_r.addPostData({
    "shelf":1,
    "resource":resource_id,
    "radio":radio,
    "mode":NA,
    "txpower": "auto",
    "suppress_preexec_method": "true"
})
lf_r.jsonPost()
```

Seeing Errors

Monitoring for Connection Errors

Use the `wsdump` utility on the LANforge to see the output of system errors and WiFi Events:

```
$ wsdump ws://localhost:8081/
```

The output will be mostly similar to what you see in the WiFi-Messages tab in the GUI:

```
< {"wifi-event":"1.1: IFNAME=sta0200 <3>CTRL-EVENT-SCAN-STARTED","timestamp":"2019-11-21T16:00:50.095Z"}
< {"wifi-event":"1.1: IFNAME=sta0200 <3>CTRL-EVENT-NETWORK-NOT-FOUND","timestamp":"2019-11-21T16:00:50.095Z"}
< {"wifi-event":"1.1: sta0200 (phy #1): scan started","timestamp":"2019-11-21T16:00:50.095Z"}
```

```
< {"wifi-event": "1.1: sta0200 (phy #1): scan finished: 5745, \"\", \"timestamp\": \"2019-11-21T16:00:50.095Z\"}
< {"wifi-event": "1.1: IFNAME=sta0220 <3>CTRL-EVENT-SCAN-STARTED\", \"timestamp\": \"2019-11-21T16:00:50.095Z\"}
< {"wifi-event": "1.1: IFNAME=sta0220 <3>CTRL-EVENT-NETWORK-NOT-FOUND\", \"timestamp\": \"2019-11-21T16:00:50.095Z\"}
```

The message CTRL-EVENT-NETWORK-NOT-FOUND indicates that the SSID we are attempting to connect to is unavailable.

Interpreting Python HTTP Error Output

It won't be uncommon to find errors similar to this:

```
Url: http://localhost:8080/cli-form/set_port
Error: <class 'urllib.error.HTTPError'>
Request URL:
'http://localhost:8080/cli-form/set_port'
Request Content-type:
'application/x-www-form-urlencoded'
Request Accept:
'application/json'
Request Data:
(b'shelf=1&resource=1&port=sta0200&current_flags=2147483649&interest=75513858&r
b'eport_timer=8000')
```

The HTTPError exception is just some kind of 500 error and is often **timing** related. Perl scripts are subject to similar timing issues. When LANforge is busy creating and destroying stations, it is modifying the network stack during each modification...and this takes time.

You can decode this `set_port` request data by pasting the individual values into the `/help/set_port` page provided by your LANforge client: http://localhost:8080/help/set_port.

- shelf 1
- resource 1
- port sta0200
- current_flags 2147483649
- interest 75513858
- report_timer 8000

For numerical flag fields, you can use the  button to try and decode the values of the flags.

Using the Scripts on Your Laptop

You can copy the `py-json` directory to your laptop or workstation. You may also use `git` and clone the LANforge-scripts repository: <https://github.com/greearb/lanforge-scripts/>.

 If you make a script on a Windows laptop and copy it back to your LANforge,

```
please run dos2unix on the script to change the line-ending characters: $
dos2unix myscript.py
```

Python Module Methods

LFRequest.py

Create a new LFRequest object to help create a request:

```
lf_r = LFRequest.LFRequest(base_url+"/port/1/1/wiphy0")
wiphy0_json = lf_r.getAsJson()
```

Your REST requests are discussed in the [Querying LANforge GUI for JSON Data](#) chapter.

formPost(show_error=true)

This method formats post data as `application/x-www-form-urlencoded` data. There should be no significant difference between this and the `jsonPost()` method.

jsonPost(show_error=true)

This method formats post data as `application/json` data. There should be no significant difference between this and the `formPost()` method.

get(show_error=true)

Use this method to do a GET request with 'Accept: application/json' headers. You get unformatted results.

getAsJson()

Formats the results of `get()` into Objects using `json.loads()`

LFUtils.py

def staNewDownStaRequest(sta_name, resource_id=1, radio="wiphy0", flags=ADD_STA_FLAGS_DOWN_WPA2, ssid="", passphrase="", debug_on=False):

For use with `add_sta`. If you don't want to generate mac addresses via patterns (xx:xx:xx:xx:81:*) you can generate octets using `random_hex.pop(0)[2:]` and `gen_mac(parent_radio_mac, octet)` See http://localhost:8080/help/add_sta

def portSetDhcpDownRequest(resource_id, port_name, debug_on=False):

Sets port admin down. See http://localhost:8080/help/set_port

def portDhcpUpRequest(resource_id, port_name, debug_on=False):

Sets port up and to use DHCP. See http://localhost:8080/help/set_port

def portUpRequest(resource_id, port_name, debug_on=False):

Sets port up. See http://localhost:8080/help/set_port

def portDownRequest(resource_id, port_name, debug_on=False):

Sets port down. Does not change the `use_dhcp` flag See http://localhost:8080/help/set_port

def generateMac(parent_mac, random_octet):

Helps generate a random mac address.

def portNameSeries(prefix="sta", start_id=0, end_id=1, padding_number=10000):

This produces a named series similar to "sta000, sta001, sta002...sta0(end_id)" The `padding_number` is added to the start and end numbers and the resulting sum has the first digit trimmed, so `f(0, 1, 10000) => {0000, 0001}`

def generateRandomHex():

Use in conjunction with `generateMac()`

def portAliasesInList(json_list):

Return reverse map of aliases to port records. Normally, you expect nested records, which is an artifact of some ORM that other customers expect:

```
[
  {
    "1.1.eth0": {
      "alias": "eth0"
    }
  },
  { ... }
]
```

Naturally, this is more difficult to digest. This method returns a more intuitive structure:

```
{
  "eth0" : {
    "1.1.eth0": {
      "alias": "eth0"
    }
  },
  "eth1": {},
  ...
}
```

def findPortEids(resource_id=1, port_names=(), base_url="http://localhost:8080"):

returns PortEID objects matching requested port_names. Use after `set_port`

def waitUntilPortsAdminDown(resource_id=1, port_list=()):

Sleep and query until all ports report admin down. Use after `set_port`

def waitUntilPortsAdminUp(resource_id=1, port_list=()):

Sleep and query until all ports report admin up. Use after `set_port`

def waitUntilPortsDisappear(resource_id=1, port_list=()):

Sleep and query until requested ports have entirely gone away. Use after `rm_vlan`

def waitUntilPortsAppear(resource_id=1, port_list=()):

Sleep and query until requested ports have appeared. Use after `add_sta`
